

Week 8: Enterprise AI Solutions and Practical Considerations

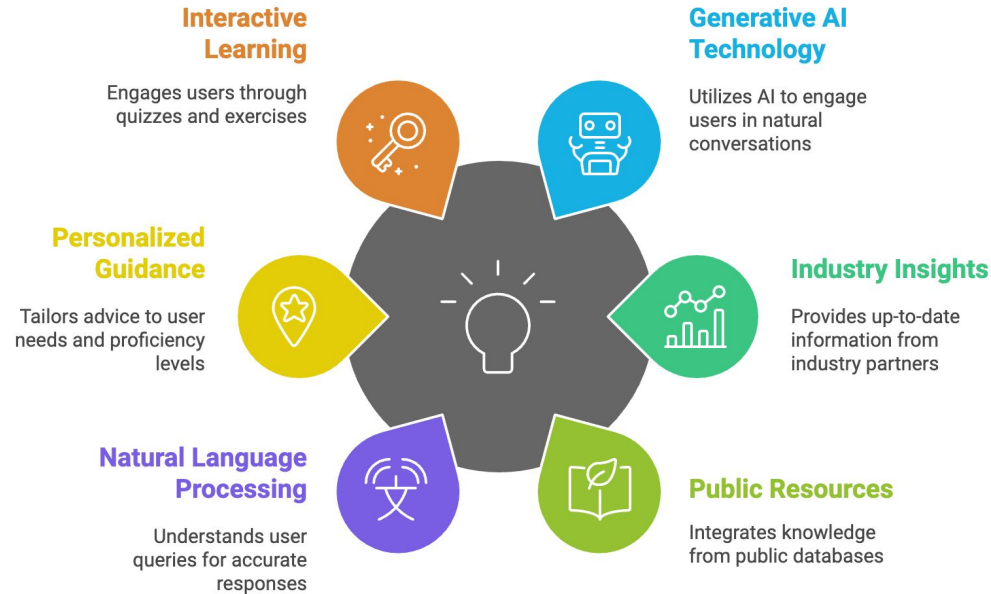

Course: BUSM2725 AI and Analytics for Business Applications

Outline

- Review the DataInsight case study
- Activities: What knowledge do we need to power the DataInsight Agent?
- Activity: Develop and present conceptual design of DataInsight Agent
- Activity: Build the DataInsight Agent
- Activity: Cost Analysis.

Review the DataInsight Case Study

Components of DataInsight Copilot

What are potential alternatives on the market?

- Is there anything close to the AI agent or chatbot proposed in this project?
- What are the pros and cons of the existing solutions?
- Evaluate the identified chatbots against a set of criteria such as user engagement, pedagogical effectiveness, technological innovation, and scalability
- You can leverage NotebookLM or Perplexity for this task
- Generate an infographic for the Competitive Analysis and share that with the class

Activities: What knowledge do we need to power the DataInsight Agent?

- Discuss your notes prepared before the class with your group
- Develop a list of up to 10 data sources (websites, documents, etc.)
- Review the data sources based on the factors in the next slides
- Rank the data sources based on these factors (using weights, voting, etc.)
- Select top 2-4 data sources
- Share your justifications

Factor	Definition for DataInsight Copilot
Authoritative Pedagogy	Sourcing from foundational experts to ensure the agent teaches "evergreen" visualisation principles.
Industry Benchmarks	Data from BI leaders (Tableau, PowerBI, Google Looker) to provide tool-specific best practices and modern UI/UX standards.
Data Veracity	The degree to which the "problem-solving" advice aligns with actual statistical and data science truths to avoid misleading users.
Contextual Metadata	Tagging information by "User Proficiency" (e.g., Student vs. Executive) so the chatbot can adjust its tone and technical depth.
Refresh Latency	The frequency with which new industry trends (e.g., AI-augmented analytics) are ingested to keep the "Continuous Learning" feature relevant.
Format Diversity	A mix of code snippets (Python/R), design templates (SVG/PNG), and text-based storytelling frameworks (The Hero's Journey in Data).
Ethical & IP Guardrails	Ensuring that "knowledge from industry partners" is scrubbed of proprietary data and complies with copyright/usage licenses.
Semantic Granularity	Breaking down complex tutorials into "micro-concepts" so the agent can provide specific step-by-step assistance rather than long walls of text.

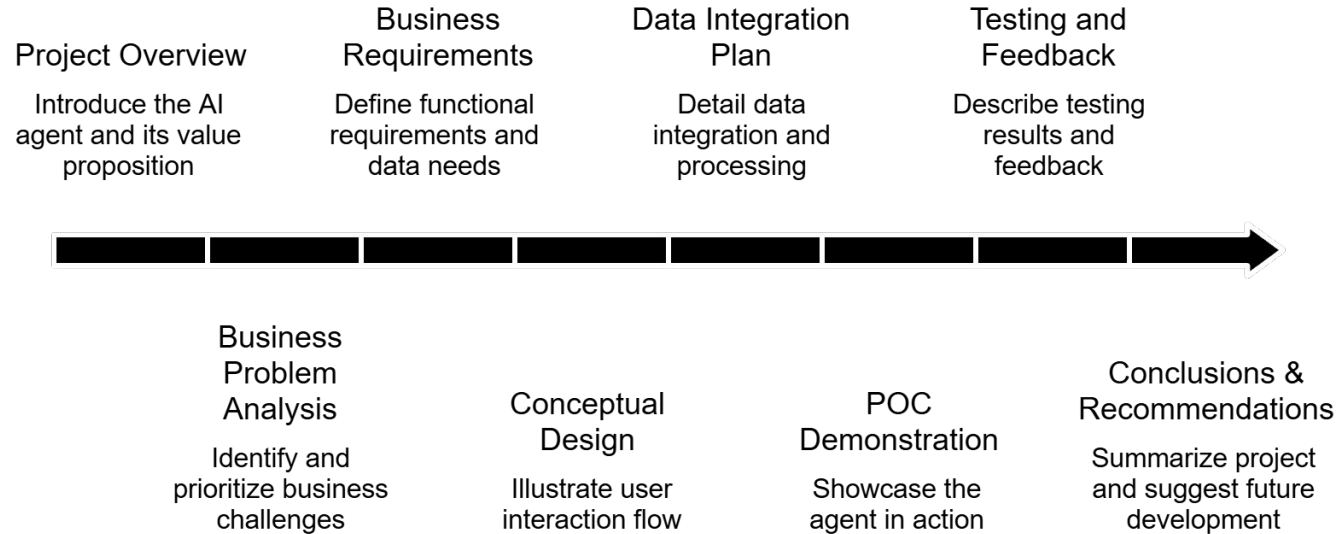

Activity: Develop and present conceptual design of DataInsight Agent

- Brainstorming the ideas and features required for the agent
- Outline the agent's primary functions, including content delivery methods, interactive exercises, and feedback mechanisms.
- Create a flowchart that details the user's journey through different learning modules, highlighting points where data integration enhances the learning experience.
- How do you plan to integrate data or knowledge into the agent
- Illustrate your conceptual design using diagrams and flowcharts to visualise the chatbot's architecture and interaction flow

Activity: Build the DataInsight Agent

- Choose a tool to build the DataInsight Agent
- Options: Val, Gemini, ChatGPT, Claude
- Perform internal testing (within your group)
- Invite members from other group to test your prototype
- Record the feedback and present to the class how the prototype can be further improved

Q&A for Assessment 2

Made with  Napkin
